## **BlueSpace® TransMail 4.0 Achieves General Availability**

*Unique, Multi-Level Messaging System Released June 30, 2008 to Partners and Intelligence, Defense and Law Enforcement Customers*

**AUSTIN, TX, June 30, 2008** – BlueSpace Software Corporation, a leader in trusted messaging systems, announced that TransMail 4.0 has completed testing and assurance and has been released to authorized BlueSpace partners and customers. TransMail 4.0 Trusted Edition, provides a single messaging inbox for intelligence analysts to communicate across multiple security domains along with the policy controls and security capabilities that have always been part of the design of TransMail.

TransMail 4.0 Trusted Edition utilizes the BlueSpace Trusted Service Bus which enables controlled communications between security domains by leveraging the capabilities of Solaris 10 Trusted Extensions and the secure architecture of the Sun Ray desktop system. This approach results in a highly secure, multi-level system that is much easier to certify than “cross domain” approaches. As previously announced, BlueSpace is seeking EAL certification of the Trusted Service Bus.

Trusted Edition users have a modern Web 2.0 messaging user interface with single multi-level inbox and the ability to securely search and manage folders across security domains. These key capabilities can significantly improve analyst information sharing and productivity resulting in more accurate, actionable and timely intelligence.

As previously announced, the 4.0 version of TransMail builds on the strengths of version 3.0 with additional capabilities including:

- Much richer XML based user attributes and message tags that are defined and managed by the customer to fit their mission and processes.
- Full ability to use attributes and tags within rules to define access control, communication and retention policies.
- Comprehensive retention management.
- In memory rule processing to support “instantaneous” sending and enterprise scalability.
- New Web 2.0 and Outlook user interfaces.
- Standards based architecture using Java, relational databases for persistence and modern 3 tier design for enterprise availability and scale.

## **About BlueSpace**

“BlueSpace Software is a leading provider of trusted messaging and multi-level solutions. BlueSpace TransMail is a messaging system that was built from the ground up to be “secure by design”. TransMail supports metadata integration into messages via XML, and this data can be used within customer defined rules to define access control, communication and retention policies – enabling attribute-based information sharing, backed up by rigorous audit logs. This design enables TransMail to be core to secure messaging solutions in defense, intelligence, government, health care and financial services. TransMail Trusted Edition is the first commercial off-the-shelf (COTS), multi-level end user application – providing a user with a single inbox for messages across multiple classification levels. Also available, the BlueSpace Trusted Service Bus enables rapid development of multi-level user interfaces for both COTS software applications and custom solutions. BlueSpace is privately held and is headquartered in Austin, Texas.”
