BlueSpace® CEO Justin Marston Speaking at IAS 2009

Visionary Talk on "Multi-Level Applications" Reinforced By Real Technology From BlueSpace at Information Assurance Symposium in Dallas, Texas February 3-5

AUSTIN, TX, January 26, 2009 – BlueSpace Software Corporation, a leader in trusted messaging systems, announced that CEO Justin Marston will be speaking at the Information Assurance Symposium in Dallas, Texas on February 3rd to the 5th. Mr. Marston will discuss his perspective on how MLS technologies are changing, and why these new technologies will gain traction where others have failed.

To reinforce the talk, BlueSpace will also be demonstrating production and prototype multi-level applications that demonstrate the power of multi-level architectures.

“The defense and intelligence communities are under tremendous pressure to respond almost instantaneously, be more productive, share more effectively and do so while fully maintaining the security of critical information,” stated Mr. Marston. “Existing approaches such as data guards and cross domain applications take too long to develop, take too long to certify, are costly and have significant security risks. An effective multi-level approach addresses all of these issues.”

“Our clients are deeply interested in multi-level solutions” noted Jeff Moore, VP of Business Development at Sterling Computers. “There is no question that this approach is going to dramatically change our ability to get solutions to the warfighter and intelligence community in a fraction of the time and at a fraction of the cost.” Sterling Computers is a preferred integration partner and reseller of BlueSpace Software.

About BlueSpace

“BlueSpace Software is a leading provider of trusted messaging and multi-level solutions. BlueSpace TransMail is a messaging system that was built from the ground up to be “secure by design”. TransMail supports metadata integration into messages via XML, and this data can be used within customer defined rules to define access control, communication and retention policies – enabling attribute-based information sharing, backed up by rigorous audit logs. This design enables TransMail to be core to secure messaging solutions in defence, intelligence, government, health care and financial services. TransMail Trusted Edition is the first commercial off-the-shelf (COTS), multi-level end user application – providing a user with a single inbox for messages across multiple classification levels. Also available, the BlueSpace Trusted Service Bus enables rapid development of multi-level user interfaces for both COTS

software applications and custom solutions. BlueSpace is privately held and is headquartered in Austin, Texas.”
